HOODLRZ GEN KIDS

3,333 generative pieces whose rendering engine lives inside the blockchain. Not an image stored on-chain — the program that draws it.

ROBINHOOD CHAIN

FREE MINT

ERC-721

NOT A SET OF PICTURES.

A PROGRAM.

Most on-chain collections store an image, or a link to one. Here the rendering engine itself — 116 KB of it — is written into the contract.

When a marketplace asks for a token, the contract reassembles that program, injects the token's hash into it, and hands back a complete, animated page. No IPFS. No server of ours. Nothing to keep paying for. If our site disappears, every Kid still renders.

Every piece draws itself, live, from its own seed. The hood, the face, the hat, the backdrop, the equaliser, the punchline — all of it is code running in the viewer's browser, not pixels fetched from somewhere.

Traits are computed, never stored

The contract derives all nine traits from the token hash using the same arithmetic the JavaScript engine uses — the same pseudo-random generator, reproduced in Solidity down to its 32-bit overflow behaviour. Both sides were run over all 3,333 pieces and compared one by one before anything was deployed.

Nobody knows what they are minting

Token hashes come from a single seed that does not exist while minting is open. It is set once, irreversibly, after the pieces have already found their owners, and the mint cannot reopen afterwards. The reveal is a two-step call anyone can make — commit to a block that does not exist yet, then read its hash — so nobody, the creator included, picks the seed or the tokens.

The renderer is locked

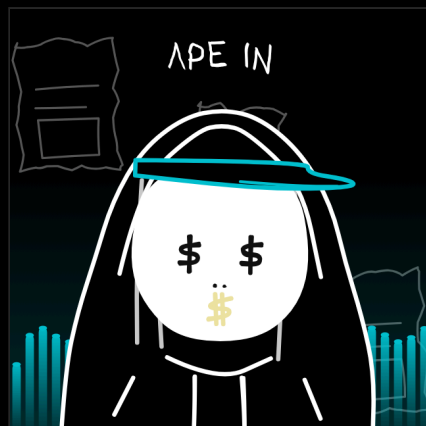

Once the output has been verified from the chain, the renderer address is frozen by an irreversible call. After that, nobody can change how an already sold piece looks — not even us.

NINE TRAITS, DRAWN BY CODE

Hat · Hat Color · Hood Color · Face · Hair · Backdrop · Palette · EQ Color · Expression. All derived on-chain from the token hash. The pieces below are live renders from arbitrary hashes — they are not part of the collection.

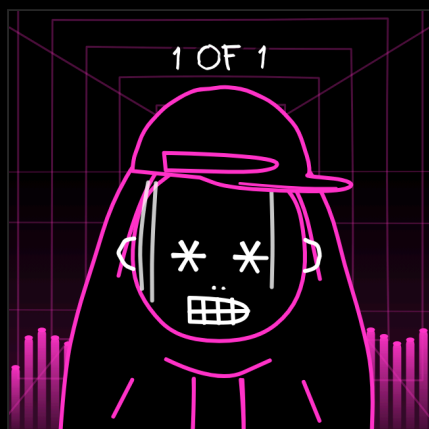

HAT crown FACE Classic BACKDROP metro
EXPRESSION SLEEPY

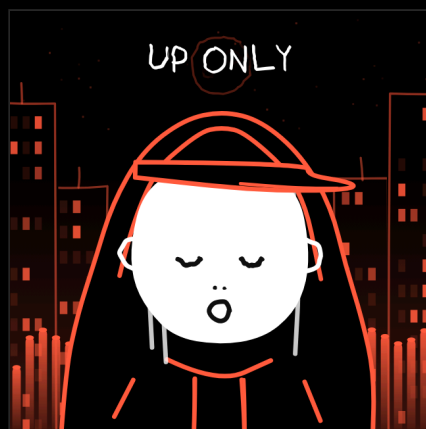

HAT visor FACE Skull BACKDROP posters
EXPRESSION GREEDY

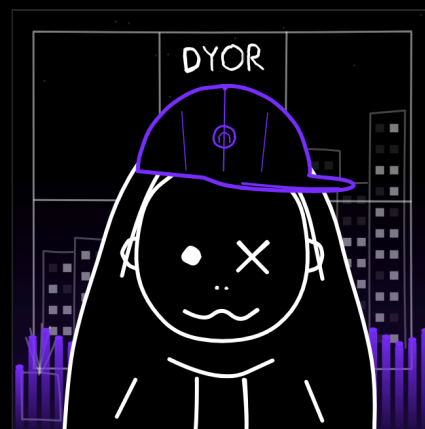

HAT snapback FACE Classic
BACKDROP penthouse EXPRESSION SLEEPY

HAT snapback FACE Classic
BACKDROP metro EXPRESSION SHOOK

HAT visor FACE Skull BACKDROP city
EXPRESSION SLEEPY

HAT fitted FACE Classic
BACKDROP penthouse EXPRESSION GLITCH

Each piece is animated: the backdrop scrolls, the equaliser reacts, and the punchline changes when the artwork is touched. A still frame is a poster of the work, not the work.

COLLECTION

COLLECTION	Hoodlrz Gen Kids
ARTIST	XERAK
SUPPLY	3,333
PRICE	Free — network gas only
PER WALLET	10
CREATOR RESERVE	300, minted before the public window opens
ALLOWLIST	OG Hoodlrz holders, by snapshot, Merkle proof
CHAIN	Robinhood Chain (Arbitrum Orbit)
STANDARD	ERC-721, EIP-2981
STORAGE	Fully on-chain — SSTORE2
METADATA	Built on-chain, base64 data URI
ARTWORK	Animated HTML canvas engine, stored in the contract
ROYALTIES	5%
SCHEDULE — PARIS TIME	

MINT

HOLDER SNAPSHOT	11 Sept, 16:00 CET Every wallet holding an OG Hoodlrz at this block enters the allowlist.
ALLOWLIST MINT	11 Sept, 17:00 CET One hour, reserved for the snapshot. Free, capped at 10.
PUBLIC MINT	11 Sept, 18:00 CET Open to anyone. Same price, same cap.
WINDOW CLOSES	11 September 2036 A long backstop. The mint ends on sell-out or when the creator closes it; the reveal follows within thirty days.

The contract compares against block timestamps in UTC; the times above are the same instants, written for humans.

WHAT ANYONE CAN CHECK

We say **fully on-chain**, and never *immutable forever*. The first is true and verifiable by anyone. The second would not be honest on a chain whose sequencer is centralised and whose system contracts remain upgradable by its operator. We would rather make the claim that survives scrutiny.

ENGINE BYTES	Read the chunks back from the contract, concatenate, and compare the SHA-256 against the published fingerprint.
TRAIT DERIVATION	Both implementations — JavaScript and Solidity — were run over all 3,333 pieces and compared trait by trait.
METADATA VS IMAGE	Render the HTML the contract returns and compare the traits it draws with the attributes it declares.
ALLOWLIST	The snapshot is published as a file. Anyone can rebuild the Merkle root and check their own wallet is in it.
CONTRACTS	Source published and verified on the block explorer, from the same pinned compiler that produced the deployed bytecode.

Before anything was deployed

The full suite runs on every change: engine integrity, Merkle compatibility with OpenZeppelin, trait parity over the whole collection, an end-to-end pass through the real contract call path, reveal-on-sell-out, deployment resume, and an on-chain verifier that renders a token in a real browser. All green.

WHERE IT COMES FROM

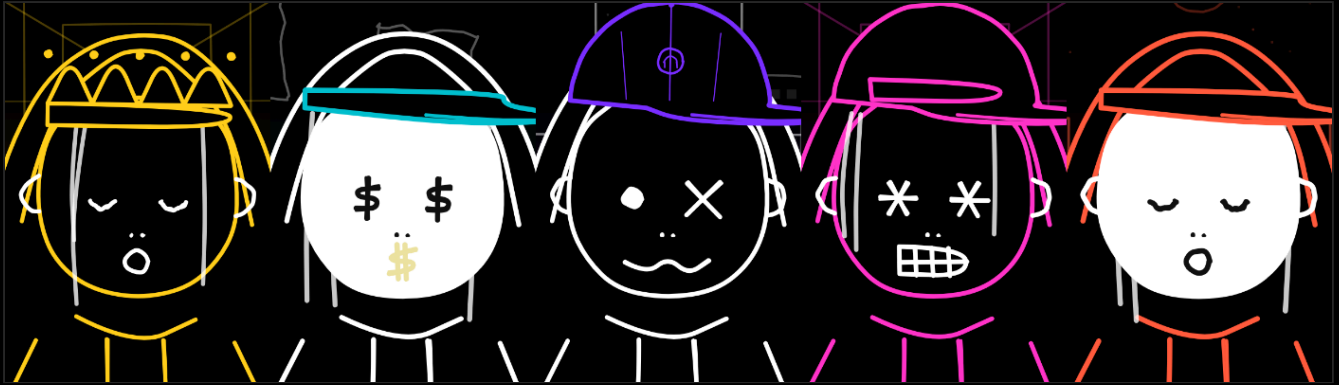

Hoodlrz is not a PFP collection. It is a universe of hooded alter-egos born from the streets and the walls — handmade art, underground culture, animated storytelling and internet rebellion fused into collectible identities.

The influences run deep. XCOPY, Rektguy and CryptoSkulls for the hypnotic loops and emotional distortion. Basquiat for raw symbolic expression and graffiti energy. KAWS for iconic collectible character identity. Banksy for the anonymous, anti-establishment spirit that runs through every piece. Musically and culturally shaped by Aphex Twin, Travis Scott, Wu-Tang Clan and MF DOOM.

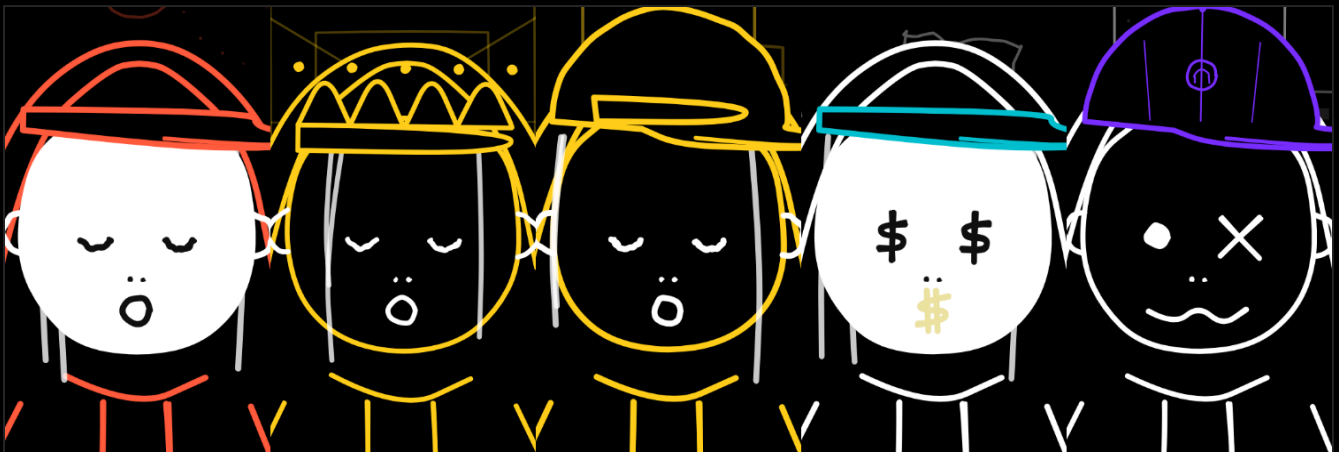

OG HOODLRZ	333 hand-drawn hooded identities on Ethereum. The origin of everything else — holding one is what puts a wallet on the Gen Kids allowlist.
GEN KIDS	3,333 generative pieces on Robinhood Chain. The subject of this document.
GENESIS VINYL	25 hand-crafted vinyl artworks across three editions, with tracks chosen by the collector.
HOODLRZ CITY	A playable city where holders explore, earn, and claim rewards. Gen Kids will appear inside the buildings of their holders.

BRAND FILES

All generated by the collection's own engine from fixed hashes — reproducible, and revealing nothing about the collection. No text is burned into any of them.
